**Rooting:**  
Start/rooting:  
hydrate substrate.

**Vegetative phase I:**  
Plants develop in volume.

**Vegetative phase II:**  
Up to growth stagnation after fructification or appearance of the formation of flowers.

**Generative phase I:**  
Flowers or fruits develop in length. Growth in height achieved.

**Generative phase II:**  
Development of the volume (breadth) of flowers or fruit.

**Generative phase III:**  
Development of the mass (weight) of flowers or fruit.

**Generative phase IV:**  
Flowers or fruit ripening process.

This cultivation schedule is intended for plants that develop flowers or fruits, starting from a one-week-old cutting or seedling. The duration of each phase depends on crop species, cultivar, desired plant size and/or plants per m<sup>2</sup>.

- \* Double CANNAZYM dosage to 19 ml/gallon, if substrate is reused.
- \*\* Increase to a maximum of 15 ml/gallon through flowering for extra strength.
- \*\*\* Adjust CANNA CALMAG AGENT application rate to achieve an ECwater of 0.2-0.4 mS/cm. This example schedule assumes that the ECwater has been adjusted with Calmag or naturally contains an EC of 0.2 mS/cm.

To set your plants up very early on as a cutting or seedling, check out CANNA Start. This is to be used prior to commencing the grow guide above. For a longer flowering phase, repeat the recommended dosages from Generative Phase I (W3-W5). Add CANNA PK 13/14 in the period 3-4 weeks before harvest.

Recommended pH is between 5.5 and 6.2.
